

# Motherboard

The motherboard is where all the computer parts tie together in one spot to work together and make the computer run. It is usually the color green, but can be other colors too.

# Hard Drive

The hard drive is where the computer's memory is.

# Fan

A computer can get very hot as it works hard to do everything we program it to do! This is why we need a fan to help cool down the working parts.

# CPU

Central Processing Unit  
This is the “brain” of the computer. The CPU is responsible for the processing of information.
